

**Storyboard for animation of Harvey – EncryptionBox
Voice over Mike West BBC TV, script LM / NHW / GH.**

START: 4 second intro – animated encryption objects flying in from the middle to out of the screen presented by the EncryptionBox official logo.

SCRIPT START – with Mike West – BBC TV voice over

When Harvey's highly sensitive documents were stolen after emailing through a leading data storage service provider, revealing details of all his sales and clients, a business competitor was found to have obtained a crucial advantage in the marketplace over Harvey's company.

Harvey decided that he must find a far more secure way of sharing files and emails urgently.

Harvey searched online and found EncryptionBox – a very secure file storage and sharing application which encrypts user files and stores them in a hidden manner away from others. It incorporates a secure messaging system that encrypts all messages between registered users making it much more secure than email. Harvey was impressed as it was so easy to use and far surpassed his expectations.

He now feels safe and secure, as the EncryptionBox way of storing and sharing files uses the same methods that banks employ to secure themselves. Their security measures far outreach those used by other file sharing and messaging services.

Unique one way encryption algorithms use a dual login methodology, incorporating an EV-SSL digital certificate to verify user credentials for extra layers of security whilst users are on the website or logging in to the application.

With its configurable individual storage areas, entire departments can choose to share between themselves or switch on sharing with other sections when collaborating on projects. Having this service built-in to EncryptionBox makes the product so easily tuned to his needs.

Harvey is also very much impressed with the secure messaging service that EncryptionBox provides, he can now share confidential messages to individual colleagues, unconcerned that he may miss vital shared files or messages, as EncryptionBox sends a text message via both mobile and email, alerting the recipient of the arrival of new files and messages instantly.

Delighted with the extreme security levels and user friendly experience of the EncryptionBox system, he now uses it throughout his company.
